Research Anthology on Emerging Technologies and Ethical Implications in Human Enhancement - Management Association, Information Resources 2020-12-18

Along with the introduction of technology in nearly every facet of human life comes the question of the ethical side of using technology to improve the human condition, whether that be physically or mentally. The capabilities of human enhancement technologies have created a dual-sided approach to discussing human enhancement: the critical approach of attempting to reach human perfection and the ethics within that idea and the endless capabilities of technology that have greatly impacted the medical field. It is essential to discuss both aspects within these emerging technologies, whether as separate entities or as cohesive units.

Ranging from disease detection and treatment to implants and prosthetics to robotics and genetic engineering, human enhancement technologies are widespread and multi-purposed. By going beyond the capabilities of human hands, these technologies have propelled modern medicine and healthcare to new levels that have allowed humans to face new treatments or assistive technologies not seen before. The Research Anthology on Emerging Technologies and Ethical Implications in Human Enhancement covers the primary technologies and tools being used in medicine and healthcare along with discussions on the ethics of enhancing the human body. Topics covered include prosthetics and implants, robotics, human disorders/diseases and treatments and smart technologies, along with law and theory. This publication serves as a valuable reference work for doctors, medical professionals, researchers, students, professionals, and practitioners involved in fields that include ethics, medicine, computer science, robotics, genetics, assistive technologies, nanotechnology, biomedical engineering, and biotechnology.

The Promise of Assistive Technology to Enhance Activity and Work Participation - National Academies of Sciences, Engineering, and Medicine 2017-08-01

The U.S. Census Bureau has reported that 56.7 million Americans had some type of disability in 2010, which represents 18.7 percent of the civilian noninstitutionalized population included in the 2010 Survey of Income and Program Participation. The U.S. Social Security Administration (SSA) provides disability benefits through the Social Security Disability Insurance (SSDI) program and the Supplemental Security Income (SSI) program. As of December 2015, approximately 11 million individuals were SSDI beneficiaries, and about 8 million were SSI beneficiaries. SSA currently considers assistive devices in the nonmedical and medical areas of its program guidelines. During determinations of substantial gainful activity and income eligibility for SSI benefits, the reasonable cost of items, devices, or services applicants need to enable them to work with their impairment is subtracted from eligible earnings, even if those items or services are used for activities of daily living in addition to work. In addition, SSA considers assistive devices in its medical disability determination process and assessment of work capacity. The Promise of Assistive Technology to Enhance Activity and Work Participation provides an analysis of selected assistive

products and technologies, including wheeled and seated mobility devices, upper-extremity prostheses, and products and technologies selected by the committee that pertain to hearing and to communication and speech in adults.

Amputation, Prosthesis Use, and Phantom Limb Pain Craig Murray 2009-12-14

The main objective in the rehabilitation of people following amputation is to restore or improve their functioning, which includes their return to work. Full-time employment leads to beneficial health effects and being healthy leads to increased chances of full-time employment (Ross and Mirowsky 1995). Employment of disabled people enhances their self-esteem and reduces social isolation (Dougherty 1999). The importance of returning to work for people following amputation therefore has to be considered. Perhaps the first article about reemployment and problems people may have at work after amputation was published in 1955 (Boynton 1955). In later years, there have been sporadic studies on this topic. Greater interest and more studies about returning to work and problems people have at work following amputation arose in the 1990s and has continued in recent years (Burger and Marinc ?ek 2007). These studies were conducted in different countries on all the five continents, the greatest number being carried out in Europe, mainly in the Netherlands and the UK (Burger and Marinc ?ek 2007). Owing to the different functions of our lower and upper limbs, people with lower limb amputations have different activity limitations and participation

restrictions compared to people with upper limb amputations. Both have problems with driving and carrying objects. People with lower limb amputations also have problems standing, walking, running, kicking, turning and stamping, whereas people with upper limb amputations have problems grasping, lifting, pushing, pulling, writing, typing, and pounding (Giridhar et al. 2001).
