The Airliner Cabin Environment and the Health of Passengers and Crew
National Research Council 2002-02-03

Although poor air quality is probably not the hazard that is foremost in peoples' minds as they board planes, it has been a concern for years. Passengers have complained about dry eyes, sore throat, dizziness, headaches, and other symptoms. Flight attendants have repeatedly raised questions about the safety of the air that they breathe. The Airliner Cabin Environment and the Health of Passengers and Crew examines in detail the aircraft environmental control systems, the sources of chemical and biological contaminants in aircraft cabins, and the toxicity and health effects associated with these contaminants. The book provides some recommendations for potential approaches for improving cabin air quality and a surveillance and research program.

Aviation Psychology and Human Factors - Monica Martinussen 2009-09-28

While it is true that fortune favors the prepared mind, in the field of aviation, it may be equally true that misfortune often punishes an unprepared mind. To be fully prepared, pilots must have comprehensive knowledge of weather, aerodynamics, propulsion, navigation, and all the other technical disciplines. However, they must also have a comprehensive understanding of the component that is simultaneously the most fragile and most resilient, the most unreliable and the most adaptable—the human being. Aviation Psychology and Human Factors explores the application of psychological principles and techniques to the specific situations and problems of aviation. It provides a complete overview of the role of psychology in the field of aviation. The authors address the contribution of psychology in the design of aviation systems, the selection and training of pilots, the psychological characteristics of pilots that may relate to aviation safety, and to the behavior of passengers. They cover key concepts of psychological research and data analysis at a depth that fosters a greater appreciation of how these tools are used in the development of new psychological knowledge. A keener understanding of aviation psychology will better prepare pilots for the demands that aviation will make. While many books cover this subject for psychologists, very few, if any present the material to pilots. With balanced coverage that makes the material accessible to both, this book makes pilots aware of the positive impact psychology and its application

can have on improving aviation operations, providing specific information that pilots can use in their daily operations. It gives psychologists a better understanding of how their discipline is applied to aviation, while giving pilots the tools to better evaluate and implement future products in the field of aviation psychology.

Human Dimension and Interior Space - Julius Panero 2014-01-21

The study of human body measurements on a comparative basis is known as anthropometrics. Its applicability to the design process is seen in the physical fit, or interface, between the human body and the various components of interior space. *Human Dimension and Interior Space* is the first major anthropometrically based reference book of design standards for use by all those involved with the physical planning and detailing of interiors, including interior designers, architects, furniture designers, builders, industrial designers, and students of design. The use of anthropometric data, although no substitute for good design or sound professional judgment should be viewed as one of the many tools required in the design process. This comprehensive overview of anthropometrics consists of three parts. The first part deals with the theory and application of anthropometrics and includes a special section dealing with physically disabled and elderly people. It provides the designer with the fundamentals of anthropometrics and a basic understanding of how interior design standards are established. The second part contains easy-to-read, illustrated anthropometric tables,

which provide the most current data available on human body size, organized by age and percentile groupings. Also included is data relative to the range of joint motion and body sizes of children. The third part contains hundreds of dimensioned drawings, illustrating in plan and section the proper anthropometrically based relationship between user and space. The types of spaces range from residential and commercial to recreational and institutional, and all dimensions include metric conversions. In the Epilogue, the authors challenge the interior design profession, the building industry, and the furniture manufacturer to seriously explore the problem of adjustability in design. They expose the fallacy of designing to accommodate the so-called average man, who, in fact, does not exist. Using government data, including studies prepared by Dr. Howard Stoudt, Dr. Albert Damon, and Dr. Ross McFarland, formerly of the Harvard School of Public Health, and Jean Roberts of the U.S. Public Health Service, Panero and Zelnik have devised a system of interior design reference standards, easily understood through a series of charts and situation drawings. With *Human Dimension and Interior Space*, these standards are now accessible to all designers of interior environments.
