Key Concepts in Measurement - Brian E. Perron 2015-03-06

Measurement refers generally to the process of assigning a numeric value to, or ordering characteristics or traits of, entities under study. Measurement is necessary for building and testing theory, specifying problems, and defining goals. It is arguably one of the most important and difficult tasks in social work research. Social work researchers who are not expert in developing, selecting, and using measures will not be able to contribute maximally to the social work knowledge base. Such knowledge and skills related to measurement ultimately determines the extent to which social work research can effectively inform social policy and social work interventions. This book is to serve as a guide for developing, selecting, and using measures in social work research. In particular, this book provides a detailed review of contemporary validity theory; an update on the major issues of reliability; common errors in measurement of latent variables; and suggestions on measurement of social networks and collectives. An important theme of this book is the focus on the creative potential of measurement - that is, helping social work researchers think about the wide variety of ways that social work concepts can be measured. Reflecting on these differences raises questions about underlying assumptions that in turn inspires creative theoretical insights. Rather than seeing measurement as simply a task to be completed in the research process, we will encourage the reader to think creatively about measurement and theory. This book also addresses the interdependency of measurement and theory construction. In other words, this book covers how measurement and theory are connected in two different ways. First, every measure has its own working theory that relates the measure to the concept being measured. Second, theory construction is dependent on measurement. What we learn using a given measure could be different if a concept was measured in a different way.

The Psychology of Alcoholism - William Swegan, Glenn Chesnut 2011-11-23

William E. Swegan ("Sgt. Bill") was the major spokesman for the psychological wing of early Alcoholics Anonymous—that group within the newborn A.A. movement of the 1930's, 40's and 50's which stressed the psychotherapeutic side of the twelve step program instead of the spiritual side. This book is Swegan's major work, in which he lays out the psychiatric theories which formed the foundation of that variety of A.A. thought. He also talks about his association with Mrs. Marty Mann, Yev Gardner, E. M. Jellinek at the Yale School of Alcohol Studies, Bill Dotson (A.A. No. 3) and Searcy Whaley, in addition to recording his memories of the year he spent observing Sister Ignatia at work at St. Thomas Hospital in Akron. In 1953 Sgt. Bill teamed up with famous American psychiatrist Louis Jolyon "Jolly" West at Lackland Air Force Base in San Antonio, Texas, to develop a method of alcoholism treatment (given further development in the mid 1960s by Dr. Joseph J. Zuska and Dick Jewell at Long Beach Naval Station) called the Lackland-Long Beach Model. It became one of the three basic types of A.A.-oriented alcoholism treatment program, along with the Minnesota Model and Sister Ignatia's more spiritually oriented approach. Sgt. Bill does not just talk psychiatric theories in this book. He uses his own life story to show how traumatic loss, poverty, inadequate self-esteem, envy, self-pity and rage can drive children and youths into isolationism, rebellion, self-sabotage, and ultimately the descent into uncontrollable alcoholism or drug addiction. But in his humanistic understanding of the twelve step program he also shows us how to make use of the healing power of the spirit of Love and Service to our fellow human beings to restore ourselves to new life.

The Johnstone Triangle Norman Reid 2021-01-18

Chemistry is often seen as a difficult subject to understand. This book focusses on the triangle model that Alex H. Johnstone developed in the early 1980s. Originally conceived in the context of making chemistry

more accessible to a wider range of learners, the model has been applied in almost every area of education in chemistry at all stages of learning. In looking at why chemistry is difficult, there are two central questions. Firstly, does the problem relate to the nature of chemistry and, secondly, does it relate to the way humans gain understanding? Both were found to be important and the answers to the two questions were found to be connected. The triangle model arose from sustained research into human learning. The central finding from research is the critical role of working memory and the model rationalises so much evidence from chemistry education research as well as the repeated experiences of teachers of chemistry at all levels. In order to understand chemistry, it is essential to develop sound mental models of molecular reality. It generates major implications for the way a chemistry curriculum should be constructed and the processes of teaching and learning in chemistry when the goal is focussed on understanding the key ideas. Some of these implications are developed and pointers offered to more successful ways forward. The power of the Johnstone Triangle lies in the way it offers clear directions for all involved in chemistry education. It is hoped that this book will prove helpful to all involved in sharing the exciting story of the way humans have come to understand the molecular world, one of the great examples of great human endeavour.
